SAPPMA Webinar V

The effect of contaminants on Polyethylene pressure pipe performance

George Diliyannis, Technical Service Leader and Subject Matter Expert for PE100 materials at Safripol (Pty) Ltd, will be addressing the effects of contaminants on the performance of Polyethylene pipe materials with a specific focus on stress crack resistance.

Presenter

SAPPMA Webinar V

24 June 2021

George
Diliyannis

Let's plastic responsibly 

Agenda

Who is Safripol

What is high density polyethylene (HDPE)

HDPE pipe materials and their benefits

Pipe extrusion

Pressure Pipe Standards

Pipe failure mechanisms

Effects on contamination on performance

Conclusion

Who we are

Founded in 1972

PET

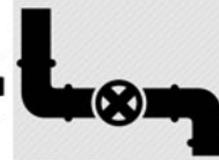

HDPE

PP

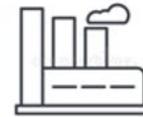

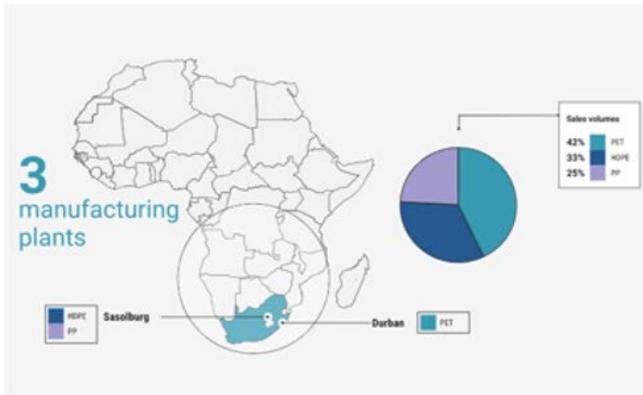

Significant local polymer producer

Our polymers are used to support the plastics converting industry

420 Employees

~540kton/a Capacity

KAP.

Let's plastic responsibly

What we are going to avoid

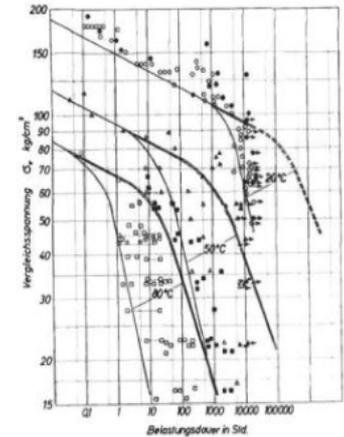

HDPE as a pipe material

Two years from invention to mainstream use:

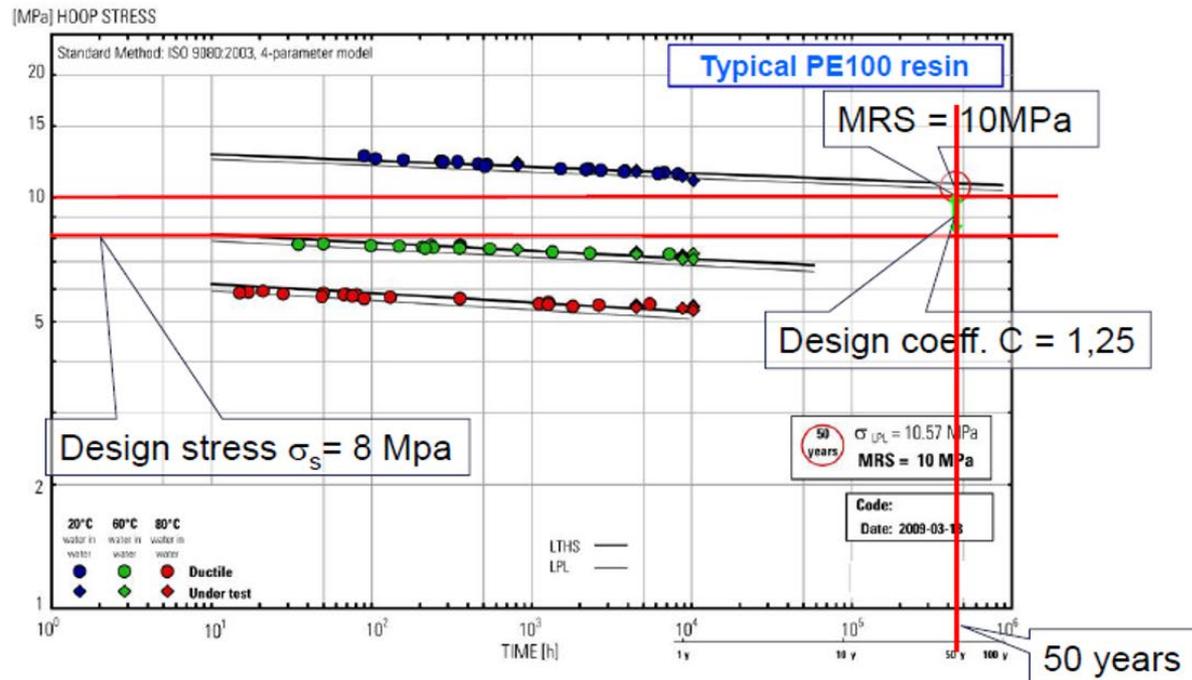

On October 18th 2012, two pipe specimens in this "historical" test have celebrated their 56th anniversary of continuous testing!

The first creep rupture tests on pipes made from HDPE were already started in 1955

Dissertation by Dr. Erwin Gaube, 1959:
"Given a permissible hoop stress of 50 kg/cm², the pipes will still have a 1.3-fold resistance to cracking after 50 years"

Classification and design stress

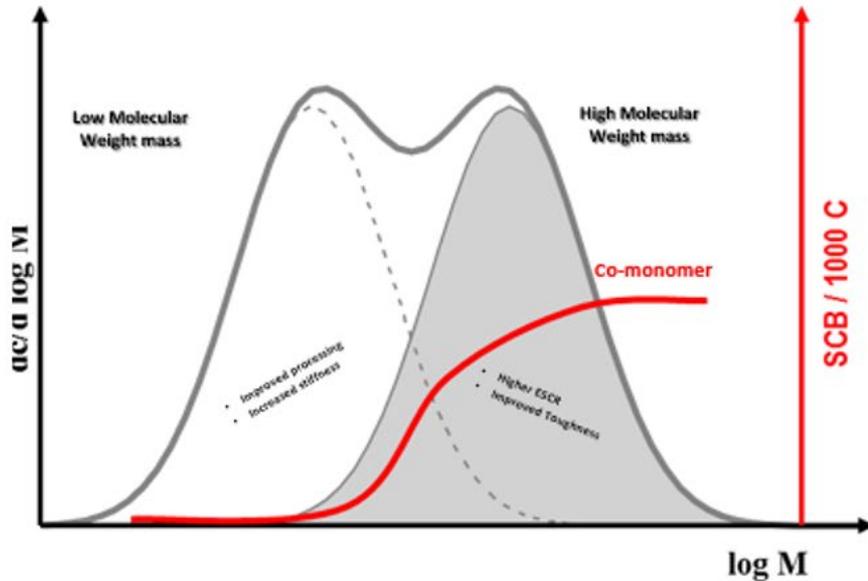

- Example of regression curve for modern day PE100:

HDPE Pressure pipe evolution

Graphic illustration of a bi-modal material:

Bimodal product features

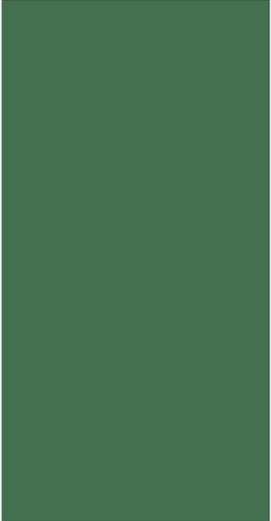

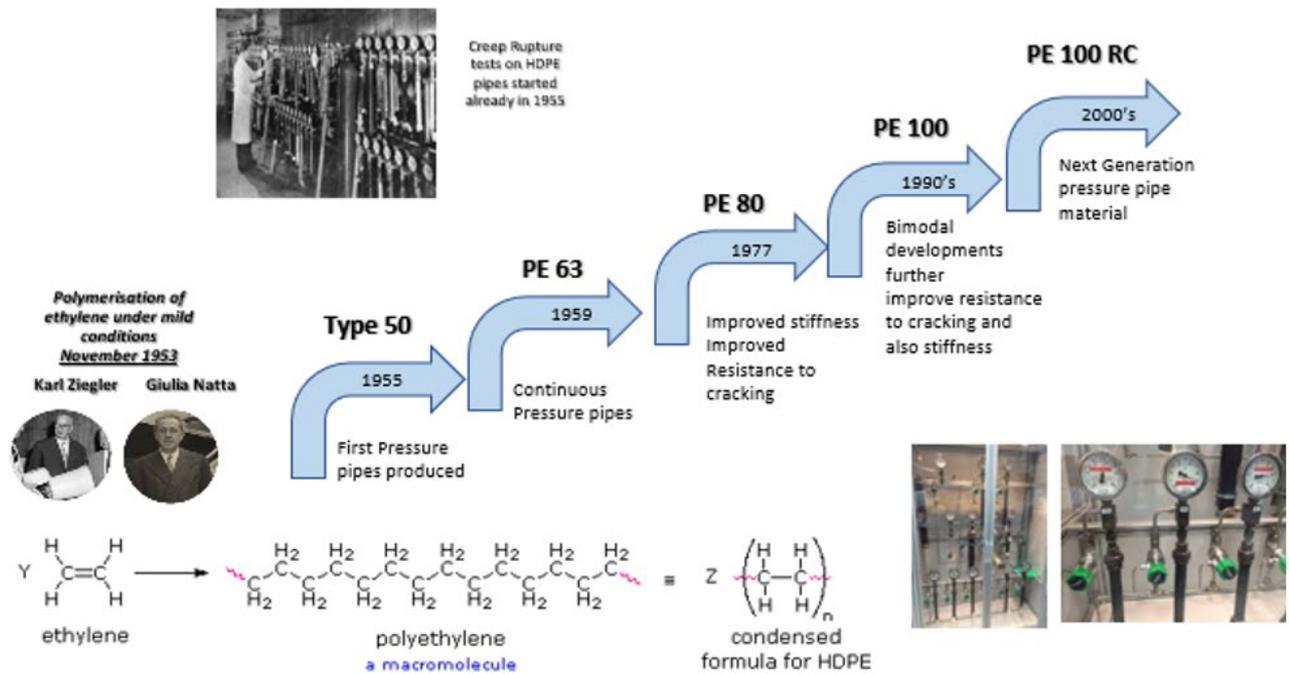

- Bimodal Molecular weight distribution (MWD)
- "Inverse" co-monomer composition distribution (CCD)
- Overcome constraints imposed by unimodal HDPE Resins

Safripol uses the Hostalen bi-modal process, now licenced by LyondellBasell to produce iMPACT100® PE100 pipe material

HDPE Pressure pipe evolution

How polyethylene pipe material has improved over the years:

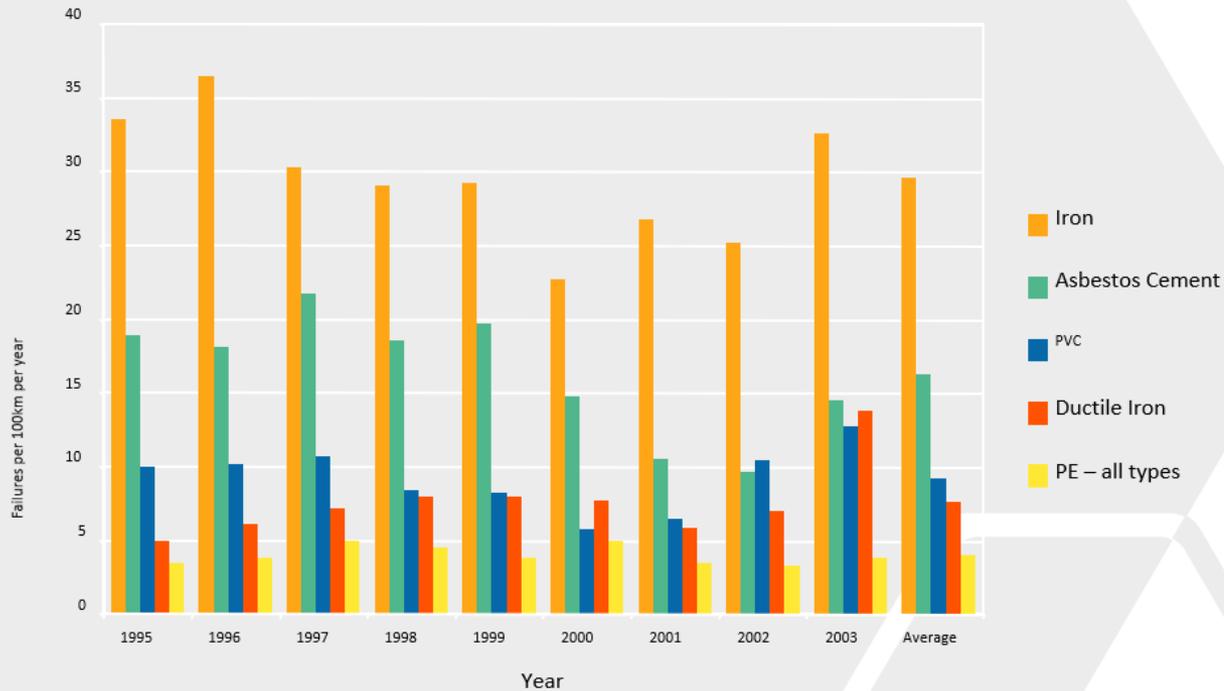

Benefits of polyethylene piping systems

Many benefits speak for themselves:

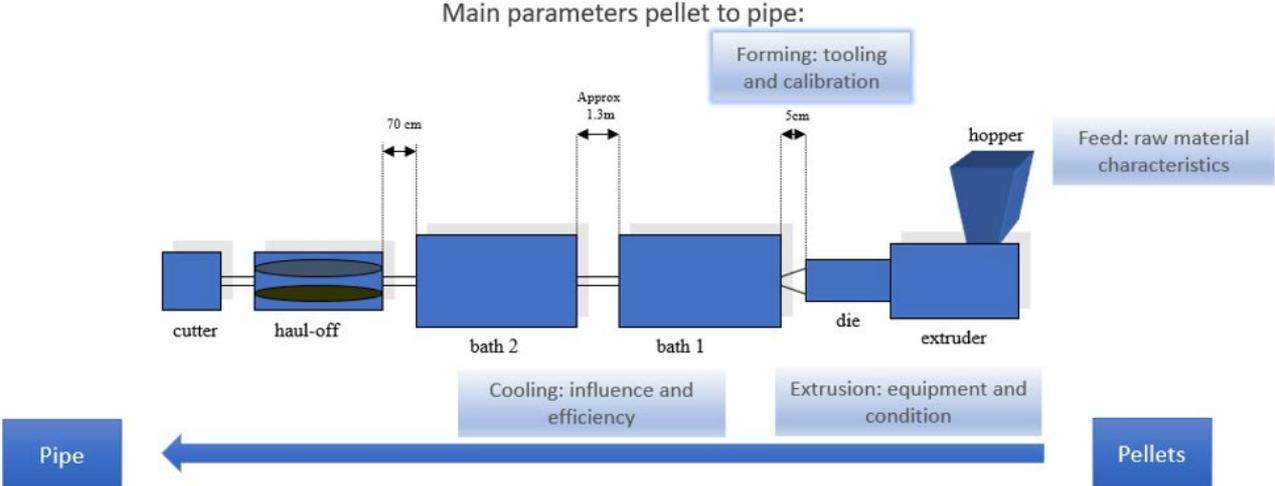

- ✓ • Corrosion resistant
 - No external protection systems required
- ✓ • Virtually leak free due to welded joints
 - Lowest leakage rate of any pipe material
- ✓ • Excellent flow characteristics for lifetime of pipe
 - Superior chemical resistance
 - Resistant to microbial growth
- ✓ • Lightweight and flexible – easy to handle
 - Lengths or coils
- ✓ • Ductile and tough
 - Resists external soil loads and internal water hammer/pressure surges
- ✓ • Manufactured under ISO / SANS 4427 Parts 1, 2, 3 and 5

Very low leakage rates

UKWIR Water Mains National Failure Database (UK):

ISO/SANS Standards – what are the material requirements?

- Extract from ISO/SANS 4427-1:

4.2.2 Black compound

The carbon black used in the production of black compound shall have an average (primary) particle size of 10 nm to 25 nm.

4.3 Use of reprocessable and recyclable material

Clean, reprocessable material generated from a manufacturer's own production and works testing of products according to ISO 4427 may be used if it is derived from the same compound as used for the relevant production. Reprocessable material obtained from external sources and recyclable material shall not be used.

4.4 Physical characteristics of the compound

The compound used for the manufacture of pipes, fittings and valves shall be in accordance with Table 1 as granules and Table 2 in the form of pipe.

Specifications

Pipe specifications (for e.g., SANS ISO4427, SANS ISO4437) outline the short- and long-term performance criteria for an integrated pipe system to be installed. This includes testing the:

material

pipe

fittings

jointing and
 installation
 (System)

Type Testing
 (TT) of a new
 material or
 component takes
 up to

2 years!

Material Type Tests (TT)

How to ensure that raw material is compliant:

- Classification (ISO 12162, ISO 9080)
- CB content / dispersion (for black resin)
- Pigment dispersion (for other colours i.e. blue / yellow)
- Melt Flow Rate (MFR)
- Thermal stability
- Resistance to gas condensate (gas applications)
- Water quality (taint & odor, microbiological growth etc.)
- RCP resistance (rapid crack propagation)
- SCG resistance (slow crack growth)

Material Type Tests (TT) carried out on pipe

How to ensure that pipes are compliant:

- Slow Crack Growth (SCG) on notched pipes
- Rapid Crack propagation (RCP) via S4 / full scale tests
- Tensile properties
- Thermal stability
- Melt Flow Rate (MFR)
- Weldability
- Weathering resistance (for colours other than black)

SANS Standards – what are the material (TT) requirements?

Table 1 — Characteristics of PE compound as granules

Characteristic	Requirement ^a	Test parameters		Test method
		Parameter	Value	
Compound density	≥ 930 kg/m ³	Test temperature	23 °C	ISO 1183-2
		Number of samples	According to ISO 1183-2	
Carbon black content (black compound only)	(2 to 2,5) % by mass	In accordance with ISO 6964		ISO 6964
Carbon black dispersion (black compound only)	≤ grade 3	In accordance with ISO 18553 ^c		ISO 18553
Pigment dispersion (blue compound only)	≤ grade 3	In accordance with ISO 18553 ^c		ISO 18553
Water content ^d	≤ 300 mg/kg	Number of test pieces ^b	1	ISO 15512
Volatile content	≤ 350 mg/kg	Number of test pieces ^b	1	EN 12099
Oxidation induction time	≥ 20 min	Test temperature	200 °C ^e	ISO 11357-6
		Number of test pieces ^b	3	
Melt mass-flow rate (MFR) for PE 40	0,2 to 1,4 g/10 min Maximum deviation of ± 20 % of the nominated value ^f	Load	2,16 kg	ISO 1133:2005, Condition D
		Test temperature	190 °C	
		Time	10 min	
		Number of test pieces ^b	According to ISO 1133	
Melt mass-flow rate (MFR) for PE 63, PE 80 and PE 100	0,2 to 1,4 g/10 min Maximum deviation of ± 20 % of the nominated value ^f	Load	5 kg	ISO 1133:2005, Condition T
		Test temperature	190 °C	
		Time	10 min	
		Number of test pieces ^b	According to ISO 1133	

- From ISO/SANS 4427-1:
- Raw material requirements in the form of granules
- As demonstrated by PE compound manufacturer

SANS Standards – what are the material requirements?

Table 2 — Characteristics of the PE compound in pipe form

Characteristic	Requirement ^a	Test parameters		Test method
		Parameter	Value	
Tensile strength for butt-fusion ^b	Test to failure: Ductile — Pass Brittle — Fail	Pipe diameter	110 mm	ISO 13953
		Pipe diameter ratio	SDR 11	
		Test temperature	23 °C	
		Number of test pieces ^c	According to ISO 13953	
Slow crack growth pipe size 110 mm or 125 mm SDR 11	No failure during test period	Test temperature	80 °C	ISO 13479
		Internal test pressure for:		
		PE 63	6,4 bar	
		PE 80	8,0 bar	
		PE 100	9,2 bar	
		Test period	500 h	
Type of test	Water in water			
		Number of test pieces ^c	According to ISO 13479	
Effect on water quality	According to existing national regulations			
Resistance to weathering ^e	Weathered test pieces shall have:	Cumulative solar radiation	≥ 3,5 GJ/m ² ^d	ISO 16871
a) Decohesion of electrofusion joint	Percentage of brittle failure: ≤ 33,3 %	Temperature	23 °C	ISO 13954
		Assembly procedure	f	
b) Elongation at break	According to ISO 4427-2:2007, Table 5			ISO 6259-1 ISO 6259-3
c) Hydrostatic strength at 80 °C	According to ISO 4427-2:2007, Table 3			ISO 1167-1

- From ISO/SANS 4427-1:

- Raw material requirements in the form of pipe

- As demonstrated by PE compound manufacturer

Material Quality Control (QC)

Additionally, for every batch of raw material supplied:

Melt Flow Rate (MFR)

Density

Pigment / carbon black dispersion

Carbon back content

Thermal stability

Volatile content

Pellet quality

The first 6 characteristics should be declared on the raw material

manufacturers Certificate of Analysis (COA)

Pipe Quality Control (QC)

As demonstrated by pipe converter:

- Dimensions
- Appearance
- Stress rupture testing
- Thermal stability
- Thermal reversion
- Tensile properties

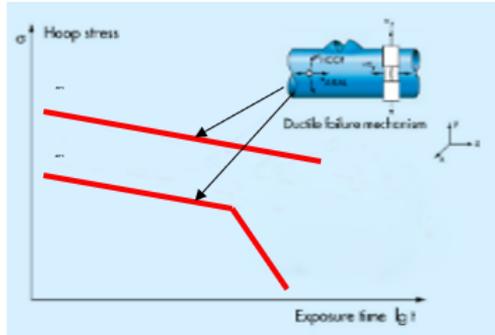

HDPE pressure pipe failure mechanisms

Polyethylene has three failure modes:

Ductile Failure:

Plastic – Viscoelastic
Mechanical property

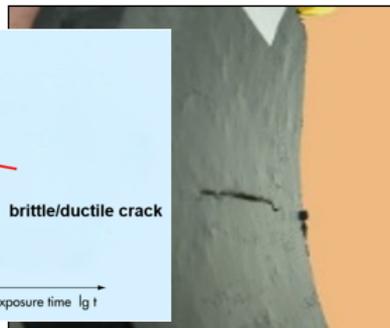

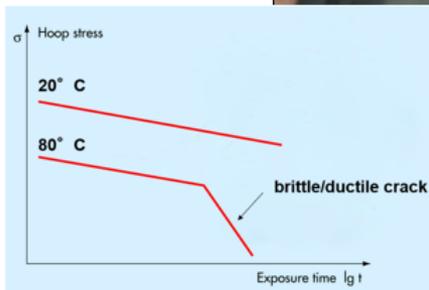

Long Term
Hydrostatic
Strength
(MRS)

Brittle Failure:

Slow Crack
Growth

Slow Crack Growth (SCG)

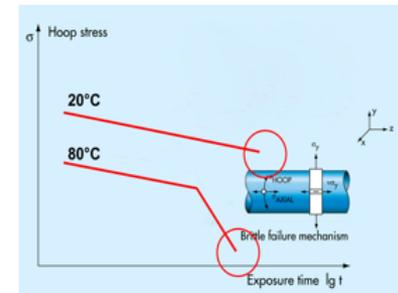

Rapid Crack Propagation (RCP)

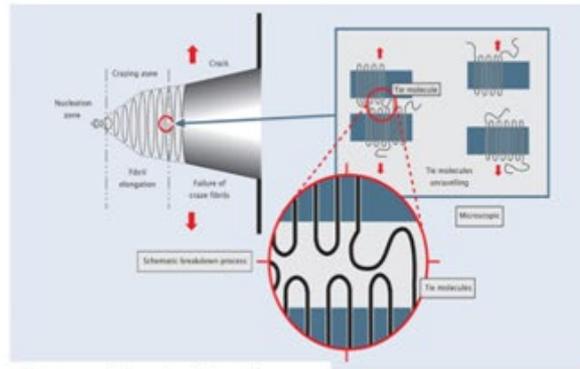

Brittle Failure:

Oxidative
degradation of
the polymer

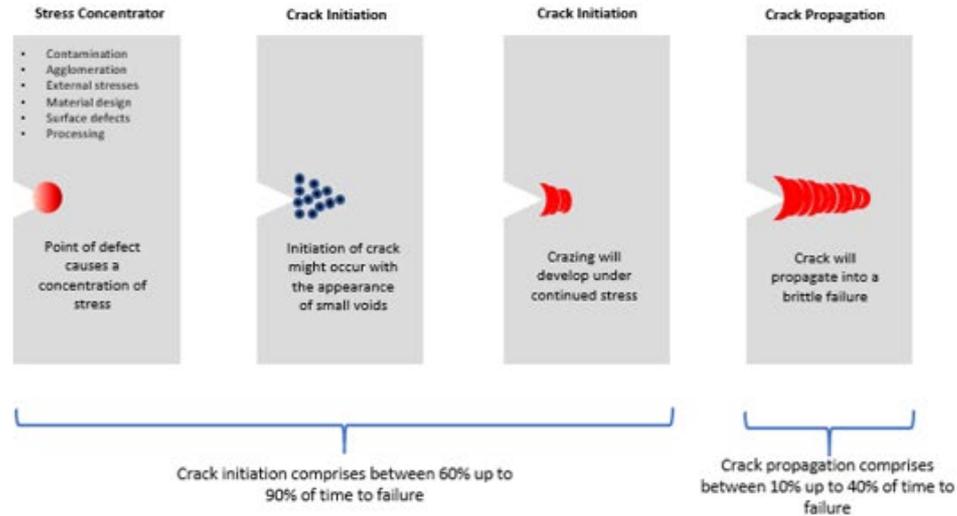

HDPE pressure pipe failure

What is slow crack growth (SCG) and how does it occur:

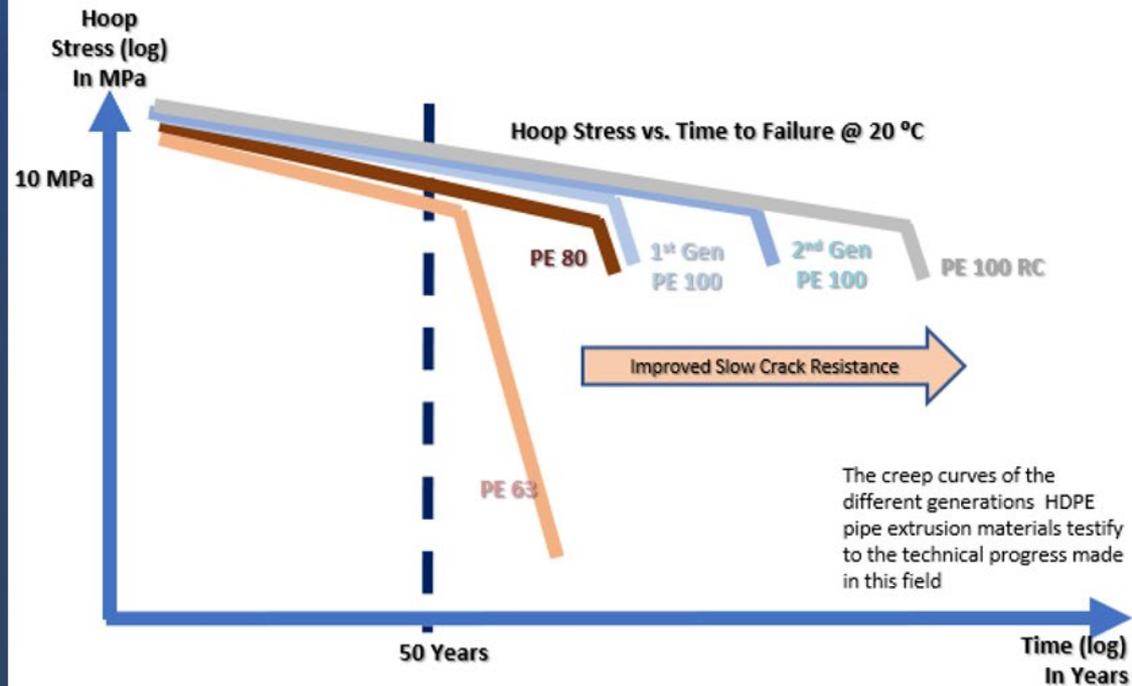

The Process of Slow Crack Growth

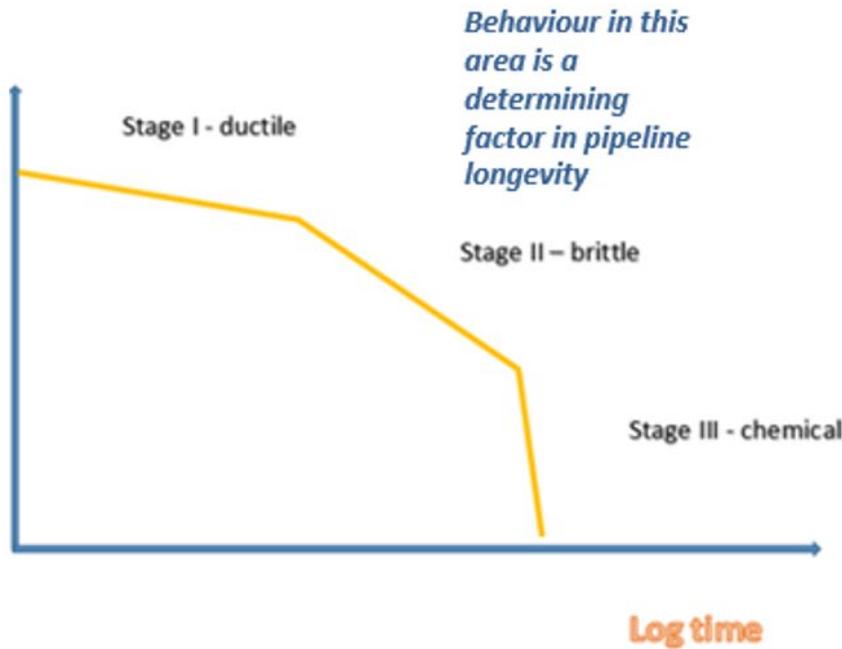

HDPE Pressure pipe evolution

Modern materials have greatly improved long term strength:

3 Failure modes of polyethylene

In practise, modern PE pipe materials way exceed the minimum SCG requirements of SANS ISO 4427:1 i.e. 500 hours notched pipe test (NPT)

So, what causes premature stage 2 failures?

Contamination and definition

Contamination is the **presence of a constituent, impurity**, or some other undesirable element that spoils, corrupts, infects, makes unfit, or makes inferior a material, physical body, natural environment, workplace, etc.

Reference: en.wikipedia.org/wiki/Contamination

- Definition of contamination:

Contamination in pipe

- In the case of polyethylene (PE100) pipe, contamination could be:

Foreign particles such as sand

Incorrectly dispersed carbon black

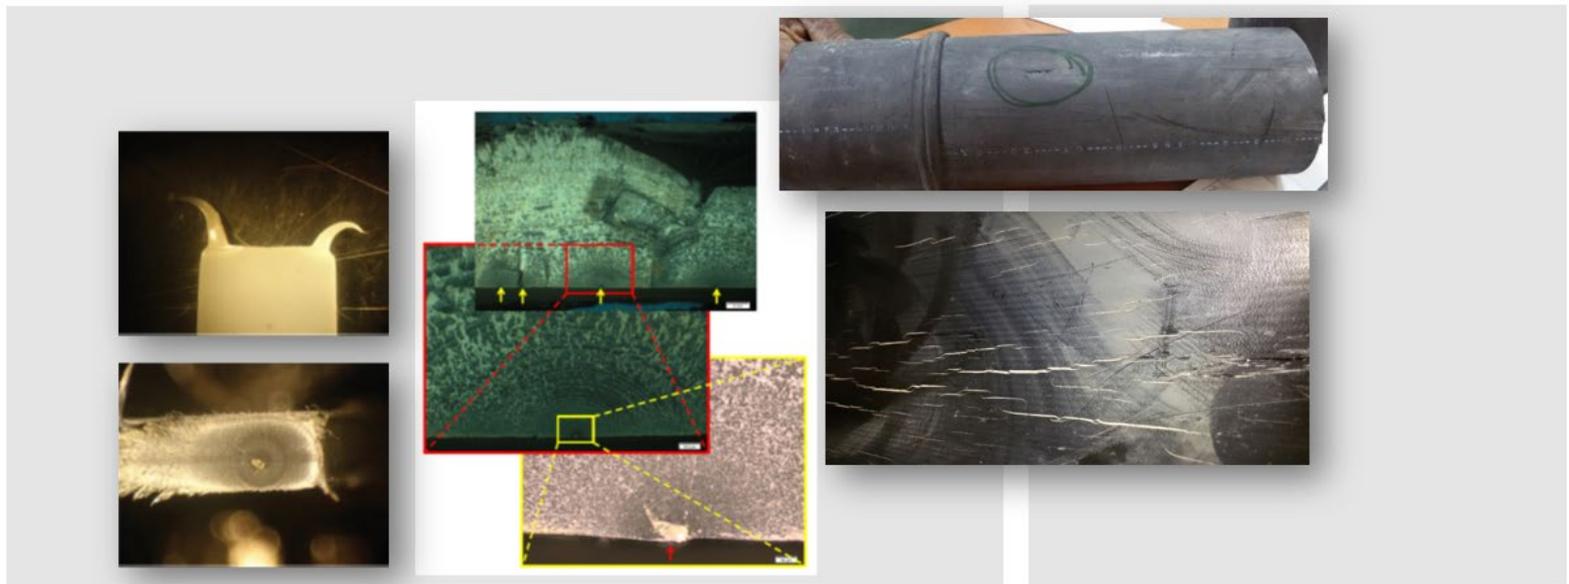

Moisture

Entrapped air

Use of non-pipe (non-PE100) materials

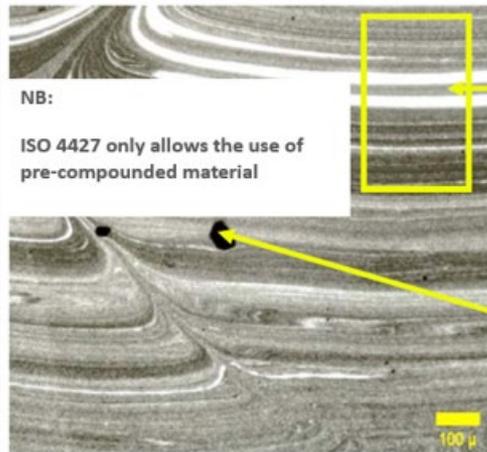

Contamination

Examples of contamination induced failures:

M. Pluimer, et al., Field Performance of Corrugated Pipe Manufactured with Recycled Polyethylene Content, NCHRP Research Report 870, 2018

Protection of PE pipes by the addition of carbon black at resin manufacturing phase

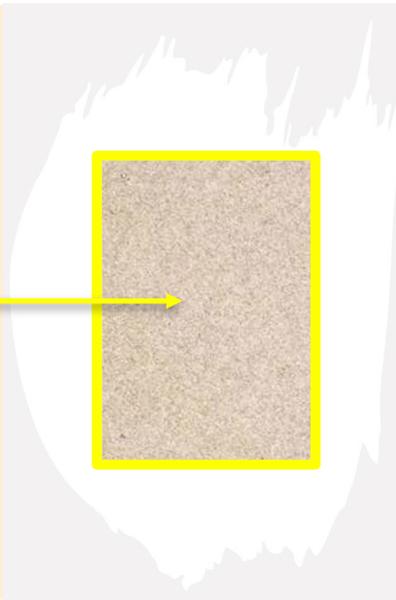

NB:

ISO 4427 only allows the use of pre-compounded material

Poor dispersion of carbon black

Good dispersion of carbon black

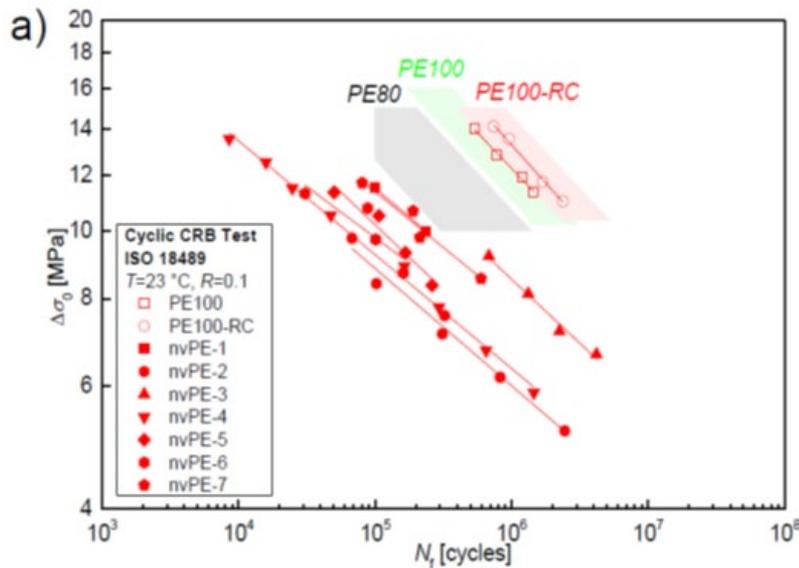

Agglomeration of carbon black

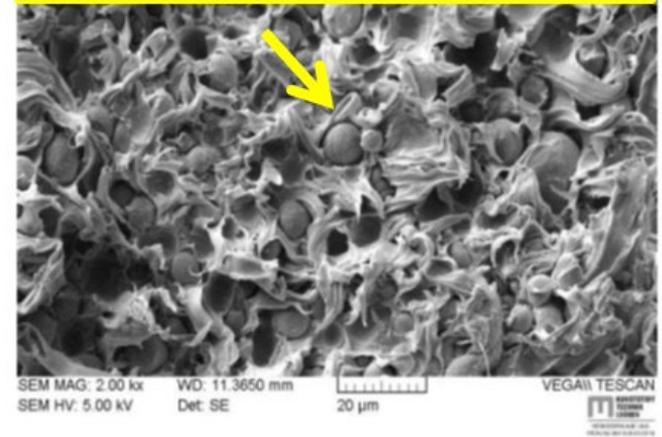

- Polyethylene pipes and fittings protected by the addition of 2 – 2.5% carbon black are not sensitive to ultra-violet light
- Carbon black prevents the penetration of the UV rays into the pipe wall and converts UV to Infrared (heat). Very limited surface 'chalking' may occur after prolonged exposure, but this will not affect the performance of the pipes

Other research: non-virgin PE (with PP)

Resistance to Cracked Round Bar (CRB) testing:

b) Inhomogeneity and defects due to spheres of PP

A. Frank, et al., *Slow Crack Growth Resistance of Non-Virgin Polymers*, Plastic Pipes XIX, Las Vegas (USA), 2018

Volatiles (moisture)

Volatiles/moisture management of PE100 carbon black containing materials:

- Carbon Black is hygroscopic and readily absorbs moisture from surrounding atmosphere
- Excessive volatile content ($\geq 0.035\%$) in the pipe resin affects quality of the finished pipe product
- ISO/SANS 4427 stipulates a maximum allowable volatile content of 0.035% (or 350ppm)

Volatiles (moisture)

Volatiles of 0.045% - effect on inner and outer surface

450SDR21 pipe – outer surface

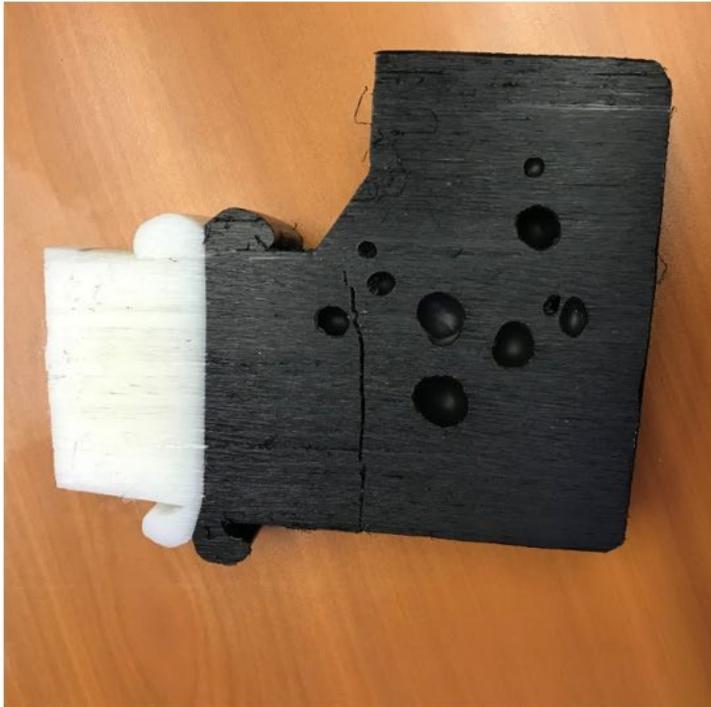

450SDR21 pipe – inner surface

Entrapped air/bubbles:

Tiny (and not so tiny) bubbles:

Residual air pockets in a fitting

Bubbles caused by excessive moisture

Post Consumer Waste in Pressure Pipe

Safripol/Qenos recycling study: objectives

- Simulate the major Post Consumer Waste recycling stream consisting of blow moulding resins in South Africa that could be used in pipe applications (*not permitted in terms of SANS and ISO standards*)
- To understand the influence on critical pressure pipe properties (SCG) when blending small part blow moulding type HDPE resins with PE100 pressure pipe resins

Post Consumer Waste in Pressure Pipe

How the recycling study was conducted:

Materials used:

- HDPE Safrene® F7665 (dairy grade HDPE)
- HDPE Safrene® M5010 Natural (pressure pipe HDPE)

Only virgin materials were used:

- Best case scenario (know the starting polymer properties)
- Homogenous blending in laboratory compounders
- No Carbon black added to eliminate variables and dilution
- Post consumer regrind stream **quality cannot** be assured
 - Contains Injection moulding & blow moulding resins
 - Contains PP, HDPE, LLDPE and LDPE
 - Contains various pigments, fillers and non pressure pipe quality carbon black
 - Pigment dispersion of all is poor

Post Consumer Waste in Pressure Pipe

Subsequent resistance to cracking:

Baseline of Virgin polymers			
Grade	Stress (Mpa)	Notch Depth (mm)	Failure Time (hrs)
Safrene® F7665 (HIC & Diary)	2.4	3.5	3hrs & 3hrs
Safrene® M5010 Natural	2.4	3.5	Taken off test prior to failure > 2790hrs
iMPACT 100®	2.4	3.5	Taken off test prior to failure > 2790hrs
Safrene® M5010 Natural/Safrene® F7665 Blends			
Blend Composition (M5010/F7665)	Stress (Mpa)	Notch Depth (mm)	Failure Time (hrs)
60/40	2.4	3.5	1.9hrs & 0.9hrs
70/30	2.4	3.5	4.2hrs & 4.2hrs
80/20	2.4	3.5	10hrs
90/10	2.4	3.5	13hrs

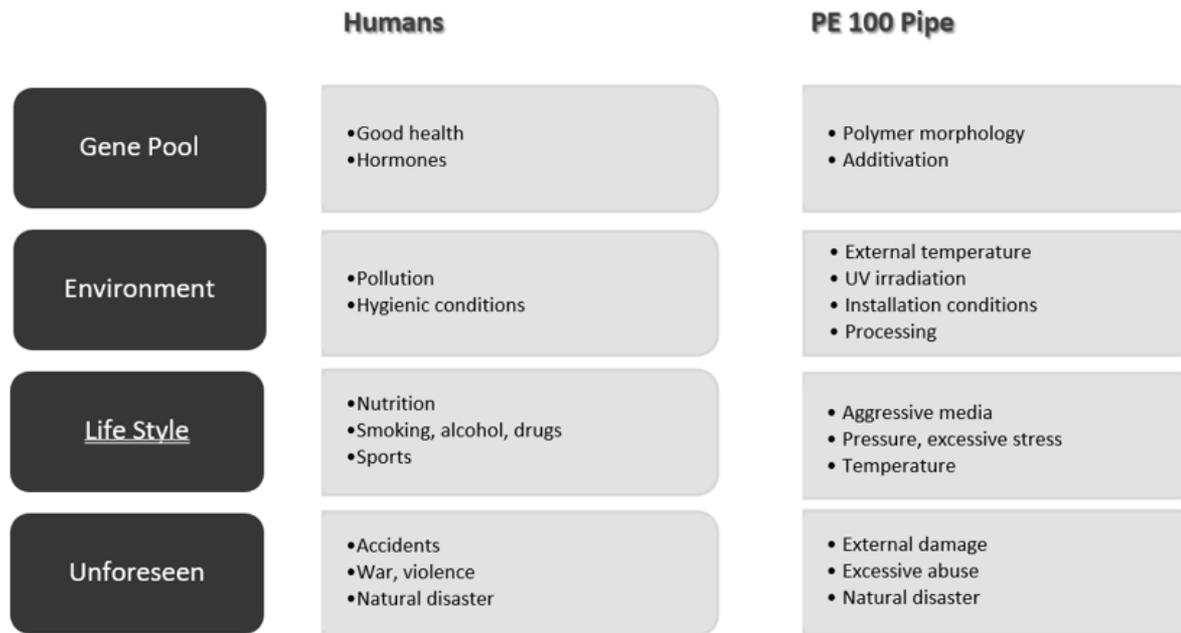

Accelerated Pennsylvania Edge-Notch Tensile Test to measure the resistance to Slow Crack Growth (SCG) of polyethylene materials

Testing conducted by Qenos

According to ASTM F1473

Life Expectancy

- Theoretically humans and pressure pipes can easily exceed a lifetime of 100 years...
- But what are the determining factors for life expectancy?

Conclusion

- Bimodal polymerization technology and polymer design has led to a vast improvements in Slow Crack Growth (SCG) resistance when compared to first generation materials
- The knowledge of failure mechanisms and the limits under these conditions allows a safe and reliable design of HDPE pressure piping systems for a life expectancy of 100 years (*according to ISO 9080 calculation*)
- Recent polymer and technology development results in improved processability and product properties for:
 - Large bore and thick wall pipes
 - Alternative installation techniques
- All plastics are not equal – PE100 is an engineered material, designed to produce pipe and fittings to last 100 years

Questions and Answers
